How to read this document

This is document 6. It was written on 26 September 2026, after you said you had been away about a week and had lost the thread of this project. It is the status note Claude wrote that day after looking through this Mac as far as it could reach (it cannot open the Trash) and every chat from 12 to 26 September. Because it began as a status note, it speaks of you as “Siddharth” or “he”. Read “he” as “you”.

A note added the same afternoon. This document was written at midday on 26 September. That afternoon you chose one public GitHub repository for everything, `fundamentals-of-finance`, and this folder became its working copy (the decision is `docs/decisions/001-one-public-repo-for-everything.md`). So the lines below that say “do not run git push”, “local-only again”, “Private always” or “one branch” no longer apply; the front page of the repository, `README.md`, has the current rules. Everything else here still holds.

Read it once, in order. Then go to `0-START-HERE.txt` in this folder for the reading order of the other five PDFs. Nothing here asks you to install, buy or decide anything today. The decisions that are yours are listed in section 6, and none of them is urgent now that the GitHub copy is private.

What went wrong on the morning of 26 September, and how it was fixed. It is fixed; nothing here needs doing today. At 10:18 India time on Saturday 26 September, in a separate chat window, Claude created a PUBLIC GitHub repository at <https://github.com/jkv8fwytbf-byte/Valuation> and pushed the whole Valuation folder to it. GitHub is a website that keeps online copies of project folders; each copy is called a repository, and “push” means upload. Siddharth had asked how to work in the cloud using GitHub, then “can you help me do it”, and when Claude asked whether the repository should be private or public, he picked Public. That chat never opened the project’s own rule files, CLAUDE.md and HANDOFF.md (the two notes Claude reads at the start of every session in this folder; that chat ran outside it). Those say this documents folder stays on his Mac only: no copy on GitHub, no remote (a saved link from the folder to an online copy), never push. That rule was written on 15 September. The plan does use GitHub later, but for a separate private code repository created at M1, only after he says “go”. What was public from 10:18 until about 11:35 that morning: 101 files (all ten PDFs, plain and colorful; every chapter; the plan and the nine research reports; CLAUDE.md and HANDOFF.md), 40 of them with his Mac username in file paths, and his personal Gmail address on all six commits (saved snapshots of the folder). That email was already public: all his other GitHub repositories, from July on, including DockerAgain, are public and carry it. No API keys or passwords were in the upload (checked twice). An API key is a secret code, like a password, that lets a program use an online service on his account. One minute later, at 10:19, a second public repository appeared on the same account, jkv8fwytbf-byte/fundamentas_of_finance, empty, made outside any Claude chat (most likely by him on the GitHub website). That chat also ended by giving him an “everyday routine” of three git commands to run after each change (git is the program on his Mac that keeps a saved history of every change to a folder). The first two, `git add` and `git commit`, save a new snapshot on the Mac. The last, `git push`, uploads the snapshots to GitHub. Do not run `git push` from this folder: the rule for it is never push, and since the link was removed it has nowhere to push to anyway. Outcome, at about 11:35 the same morning: with his approval the repository was switched to private and the folder’s link to it was removed, so the folder is local-only again. The private copy on GitHub is his to keep or delete.

1 What this project is, in plain words

Siddharth wants a private machine that does what he used to do by hand in Aswath Damodaran’s free valuation spreadsheet, for many US companies first and Indian companies later. It is for long-term investing research only, never day trading. It gives estimates, never buy or sell advice. It has seven parts:

1. A calculator that copies the spreadsheet exactly.
2. A cloud database where every number carries its source, licence label and date.
3. A “librarian” that searches Damodaran’s own writing and answers with citations.
4. A memo writer that turns a company’s story into numbers, with citations, plus an opposing memo.
5. Nightly robots that fetch company filings and re-value the watchlist.
6. A private dashboard with an accuracy scoreboard and a descriptive “is the market on the rails” panel.
7. An editor on his Mac as the control panel.

Everything runs on outside services (“they do their job, I do mine, like a contractor”); nothing is self-hosted. Budget ceiling \$200 a month. The plan has six numbered milestones, M0 to M5. M0 is the reading documents and the diagrams: no accounts, no code. It is done. M1 to M5 are in section 5 below. The whole plan, sections 0 to 10, is in docs/plan.md inside the project folder.

2 What happened, day by day (India time)

In short:

- 12 to 13 Sep: Damodaran's website was downloaded and turned into a reading library (the "corpus").
- 13 to 14 Sep: he described the project; the plan went through four versions; on 14 Sep he approved only M0.
- 14 Sep: M0 was done: five diagrams and five PDFs.
- 15 Sep: everything was put in one folder, one branch, Claude Code only; the rule "private, no GitHub, never push" was written for this folder.
- 16 to 17 Sep: side projects only (OpenRouter, Docker); around 17 Sep the corpus disappeared from Downloads.
- 18 to 22 Sep: no Claude conversations (this matches the week away).
- 23 Sep: he came back lost; Claude found nothing to resume, wrote status notes and committed them. No project work started.
- 26 Sep, 10:18: a separate chat put the folder on GitHub as a public repository, against his own rule.
- 26 Sep, 11:35: with his approval, this session made that repository private and removed the folder's link to it; this document was then written.

The detail:

- **12 Sep, evening.** Two jobs unrelated to valuation. Every markdown file on the Mac (markdown is the plain-text format the PDFs are built from) was copied into one folder, 18,935 files; that folder, called "md files", is now in ~/Documents. And a classroom JupyterHub was built with Docker. Docker packs a program and everything it needs into one big file, called an image, that runs the same on any computer. JupyterHub is a website where each student logs in and writes Python notebooks. The folder is now ~/Documents/DockerAgain (its code is on GitHub as jkv8fwytbf-byte/DockerAgain, public). Late that night something downloaded Damodaran's NYU website into about 70 zip files in Downloads.
- **13 Sep, 03:00 to 13:00.** Claude sorted Downloads into four folders. Two of them became the Damodaran corpus, the reading collection of Damodaran's own writing and data that the librarian will search later. The first is finance-and-valuation: 6,188 files, 1.1 GB in all, a copy of Damodaran's NYU website (about 6,175 files) plus 12 finance PDFs. The second is financeMD: the same files turned into 3,916 markdown files, 89 MB. The other two, books and booksMD, hold four books that are not about finance and their markdown copies. The 70 zips and duplicate PDFs were deleted. A quality audit found conversion flaws, the converter was rewritten, and everything was redone. He stopped the second audit ("just stop"). That evening, before 20:18, he moved books (with booksMD inside) out of Downloads into his personal notes folder himself.
- **13 Sep, 20:18.** The valuation project began. He described the goal and asked about many tools: pi.dev (a bare-bones AI coding assistant in the terminal), OpenRouter (one account and one key that reach many AI models), open-weight models (AI models whose makers publish the model itself, so many providers can run them cheaply), Pinecone (a service that searches text by meaning), Figma (a website for drawing designs), Vercel (a service that hosts websites), MCP (a standard plug that lets an AI assistant use outside tools) and CI (automatic checks that run every time code changes). He said "ask me as many questions as you want". He answered four questions: budget \$60 to \$100 a month at first, US first then India, research plus sector exposure of a watchlist, GitHub account jkv8fwytbf-byte. Plan v1 arrived at 21:27.

- **14 Sep, 10:40 to 14:28.** He turned the plan down five times: once each for v1, v2 and v3, and twice for v4. v1 (Python, reuse old projects, local files): “fuck everything old”, “outsource”, “no csv bullshit”, pi.dev plus OpenRouter. v2 (TypeScript on Vercel, public repo): “I can’t tell my elbow from my ass”, “hope this can be private for me only”, “use a pdf to explain stuff”, wants to learn Figma, budget can go to \$200 “but it should be worth it”. v3 (plain English, pi as daily tool, private): “I have a Cursor subscription” (Cursor is the paid AI code editor he already uses), wants diversification, accuracy, bias and variance views, “no buy sell but maybe an estimate of whether the market is on the rails”. v4 (Cursor as daily tool, open-weight models inside the product, Hex dashboard, reasoned memo with the dark side of valuation, accuracy scoreboard, market panel) drew questions (“so you are saying we ditch pi.dev? why”, “head up my ass I don’t understand”). At 14:27 he turned v4 down a second time, saying “we need to do the m0 then you save the rest so I can come back and think”, and at 14:28 he approved v4 for M0 only.
- **14 Sep, 14:30 to 16:25.** M0 was built. Five diagrams were drawn as FigJam boards (FigJam is Figma’s online whiteboard) in his Figma account, and document 1 (Read This First, 18 pages) was sent at 14:38. The background job writing the other three documents died when the session ran out of room and then hit his usage limits (11 of 14 writers failed). His Claude monthly spend limit was hit at 15:41 (“a bit tense”). A resume pass on Opus wrote the 22 missing chapters, and all four PDFs existed by 16:25.
- **14 Sep, 16:44 to 18:22.** “Just tell me what the fuck am I supposed to do?” Claude numbered the PDFs 1 to 4 in reading order and wrote 0–START–HERE.txt. He asked for the plan broken down with comments; that became PDF 5, The Plan Explained (31 pages), written that evening. A bug that dropped colons from every web link in the PDFs was fixed and all five were rebuilt and sent at 18:22. Between 17:40 and 17:45 he had the AI assistant inside Cursor turn the folder into a git repository (git keeps a saved history of every change to a folder). It made two branches, which are parallel versions of the folder: an empty main, and dev holding all the files. It also uploaded a private copy to Cursor’s own servers. That online copy was never deleted and may still exist.
- **15 Sep.** 13:52: “no need for PR right now, I have to work and you’ve gotta chill”. In the afternoon he, Cursor and Codex (another AI coding tool, from OpenAI) made colorful reading editions of the five PDFs, moved the folder from ~/Valuation to ~/Desktop/Valuation, and left the repository half broken across three tools. At 15:47 he told a fresh session “I only want to work in Claude Code”, and at 15:56 “fuck all those branches, just keep main for now”. Claude folded the other branches into the one called main, so all the files ended up there, then deleted the other branches. It removed the Cursor and Codex setup files and wrote CLAUDE.md and HANDOFF.md. It copied the plan and the nine research reports into the folder and fixed old paths in 31 files. Last, it rebuilt all ten PDFs and saved everything as commits. The rule written that day for this folder: local and private, no GitHub, never push.
- **16 Sep.** Side projects, none part of the plan. An eight-week AI learning kit appeared at ~/Desktop/remaining; Codex built it that afternoon (the original is in ~/Documents/Codex/2026-09-16/i-x20/outputs/). From 15:35 he learned OpenRouter with Claude in ~/Desktop/openrouter, added \$10 of credits himself (“don’t fuck with it”), got a readable guide (LEARN_OPENROUTER.html; a copy is now in reports/learn-openrouter.html) and a local playground; that session spent about \$0.12 of the credits. At 16:55 he used Cursor to save his OpenRouter key into the learning kit’s .env file (a plain text file that holds secret keys for the programs in that folder; its name starts with a dot, so Finder hides it). From 17:10 he set up Open WebUI (a ChatGPT-style page) in Docker on top of OpenRouter, with much anger at the 6.5 GB image and RAM use; its tests added a few cents, about \$0.15 used in all. A late plan to cut it to two models (Muse Spark 1.3 and GLM 5.3) was never carried out.
- **17 Sep.** Docker day. In the morning he chose to run Open WebUI without Docker, then changed

course. The old Open WebUI was torn down, rebuilt in Docker at `~/Docker/open-webui`, and wiped again minutes later. A backup from that rebuild (250 MB) survives in the Backups folder of his home folder, `~/Backups/open-webui`. Separately, at about 15:24 a small website called `diversify` was started on the Desktop. It is built with Next.js, a toolkit for making websites. Its starter files were saved in git; the four pages added that afternoon (portfolio, audit, library, map) were not. Later he started Open WebUI once more by hand, then at 16:38 had Docker Desktop removed “like no such thing as Docker was there on this Mac”. He had told that chat he would reinstall Docker himself, and he did so at once: at 16:52 Docker Desktop 4.91.0 went back into Applications from the installer in Downloads, and at 17:06 he started Open WebUI again, which ran until about 18:43 with no Claude chat involved. Docker is not running now, but its data (about 8 GB, mostly that Open WebUI image) is still on the Mac; the folder is named in section 3. Around this day the corpus folders vanished from Downloads (`financeMD`, `finance-and-valuation`, the workbook, the archives). Claude could not find them anywhere it was able to look on the Mac (it cannot open the Trash). No Claude session deleted or moved them, and nobody knows where they went. The four books are safe: they had left Downloads on 13 Sep, and on 17 Sep they moved with his notes folder to `~/Documents`, where they are safe.

- **18 to 22 Sep.** No Claude conversations at all. This matches the week away.
- **23 Sep, 18:35 to 18:54.** He came back saying “haywire, I don’t know what to do, resume”. Claude found M0 finished, nothing running, the folder on the Desktop, the corpus missing, and wrote a dated status block at the top of `docs/0-START-HERE.txt`, updated `HANDOFF.md`, `CLAUDE.md` and memory, and committed (5b46007). Nothing pushed.
- **26 Sep, 10:09 to 10:18.** In a “no folder” chat he asked how to work in the cloud with GitHub, then “can you help me do it”. That chat created the public repository and pushed. At 10:19 the empty public repository `fundamentas_of_finance` was created on the same account, outside any Claude chat. At 10:41 he opened this session and asked for the recap. At about 11:35, with his approval, the repository was made private and the folder’s link to it removed; this document followed.

3 What exists right now

The project folder `~/Desktop/Valuation`. It is a git folder, meaning it keeps every recorded version of its files, on one line of history called `main`. Six recorded versions (commits) were made between 14 and 23 September; the ones from 26 September saved this document and the updated notes. No changes are waiting to be recorded. It was linked to the GitHub copy for about an hour on 26 September; the link was then removed.

File or folder	What it is
<code>CLAUDE.md</code>	The briefing Claude reads first. Updated on 26 September to name the GitHub incident and this document.
<code>HANDOFF.md</code>	Live state. Says “Nothing in flight. Milestone M0, reading stage. Waiting for Siddharth.” Updated on 26 September.
<code>docs/0-START-HERE.txt</code>	Reading order, with the 26 September status block on top.
<code>docs/6-where-we-are.pdf</code>	This document.
<code>docs/1-read-this-first.pdf</code>	The system in plain words, with the five diagrams. Plain copy.

File or folder	What it is
docs/2-damodaran-essentials.pdf	The Damodaran refresher, 7 chapters.
docs/3-the-other-side.pdf	The critics reader.
docs/4-the-guide.pdf	The tools manual, 18 chapters, chapter 13 is Figma.
docs/5-the-plan-explained.pdf	The plan section by section with a comment box per part.
output/pdf/1..5-*.pdf	The colorful reading editions of the same five. These are the ones to read.
docs/plan.md	The full plan v4. Wins over PDF 5 when they differ.
docs/sources/	The nine research reports the documents cite. Read them to check a citation; do not edit them.
docs/diagrams/	The five diagrams as picture files.
docs/_build/build.sh	The script that rebuilds the PDFs from the markdown chapters. It uses two free programs already on this Mac, pandoc and tectonic.

Page counts:

PDF	Plain (docs/)	Colorful (output/pdf/)
1 Read This First	18	19
2 Damodaran essentials	53	56
3 The Other Side	47	46
4 The Guide	104	103
5 The Plan Explained	31	37

The five FigJam boards (in his Figma account, team “Siddharth’s team”, free Starter plan). The same pictures are printed in PDF 1.

- System architecture: <https://www.figma.com/board/DtFTvDZeSQpuKLM5tavDUT>
- Nightly data flow: <https://www.figma.com/board/6LSfZZfWAnbQVY0twr7OMw>
- The valuation chain: <https://www.figma.com/board/SNaMV0lrKHeDRQgelrbPsp>
- The memo pipeline: <https://www.figma.com/board/LGcrXp6yT3fh4O2lV3mEY8>
- The milestone map: <https://www.figma.com/board/LXcGUT7C2ArsRkwsUvRBWt>

Other things from this project, outside the folder: the plan file Claude first wrote the plan in, `~/ .claude/plans/help-me-out-here-abstract-wilkinson.md`. `docs/plan.md` was copied from it on 15 September and is the copy that counts. The plan file also holds an earlier draft of this recap near its top; where they differ, this document is right. There are also Claude’s memory notes, short files Claude reads at the start of a chat so that it knows who you are, how you like to work and what was agreed. They are in two folders:

- `~/ .claude/projects/-Users-siddharth-Downloads/memory/`
- `~/ .claude/projects/-Users-siddharth-Desktop-Valuation/memory/`

Missing: the Damodaran corpus (`~/Downloads/financeMD/`, `finance-and-valuation/`, the `fcffsimpleginzu.xlsx` workbook, `damodaran-data-01/02.zip`, the compressed `.tar.gz`

bundles). The PDFs do not need it; the 133 “Source:” lines in them cite its old path on purpose. It is needed again from M1 (the accounts step, the first milestone after “go”; see section 5). The originals were all free public downloads from Damodaran’s site, but financeMD was made from them on 13 September by a conversion script that lived in a temporary folder and is now gone; its code survives only in that day’s chat record. Getting financeMD back means re-downloading the site and re-running a recovered conversion, not just downloading. Look in the Mac’s Trash first; Claude cannot open it. Also gone: the old ~/Valuation folder and ~/Desktop/openrouter.

Accounts and money. No account was opened and no money was spent for this plan. Existing accounts:

- GitHub, account jkv8fwytf-byte. Every repository on it is public except the Valuation copy, made private on 26 September.
- Cursor Pro, \$20 a month, already paid.
- Claude Max, his paid Claude subscription.
- Figma, free Starter plan; it holds the five boards.
- Bloomberg.com India, a news subscription for reading only, no data.
- INDmoney, an Indian investing app where he has an account. The plan may later read his own holdings through its official API (a door for programs), read-only.

Outside the plan: an OpenRouter account with \$10 of credits (about \$0.15 used on 16 September), its key in ~/Desktop/remaining/.env with no spend limit set. That file’s own permissions are looser than they should be, but his Desktop folder is private to his account and he is the only user on this Mac.

Side projects on this Mac, not part of the plan:

- ~/Desktop/diversify: a small website built with Next.js, 17 September; starter files saved in git, the four later pages not.
- ~/Desktop/remaining: the AI learning kit.
- ~/Docker/open-webui (config only, no data) and ~/Backups/open-webui (250 MB backup).
- Docker Desktop 4.91.0 in Applications, with about 8 GB of Docker data in ~/Library/Containers/com.docker.docker, and the 584 MB installer ~/Downloads/Docker.dmg.
- ~/Documents/DockerAgain: the classroom JupyterHub, plus two compressed copies of the finished server, about 2.3 GB each.
- The “md files” folder in ~/Documents: 18,860 copied markdown files; its 12 September manifest lists 18,935.
- Codex (OpenAI’s coding app) has also been used on its own for small jobs on 12 to 17 and on 26 September: the classroom server, the learning kit and a few small jobs on the morning of 26 September. On 14 September it also made its own short PDF versions of the plan and of Read This First, kept in ~/Documents/Codex/2026-09-14/or/outputs/; they are not the official PDFs. Its folders are under ~/Documents/Codex/, and none of them touch the Valuation folder.

4 The rules he set (as of the morning of 26 September; see the note at the top)

The numbers (PDF 1 section 3):

- **Golden test.** Before it values anything else, the calculator must reproduce the worked example that comes with Damodaran's spreadsheet: Almarai, a Saudi food company, at 7.187840270062114 per share, correct to six decimal places.
- **Vintage.** Every number records which dated snapshot of Damodaran's tables it came from. Each run stores three file ids (market, country risk, industry), because 2026 alone has three risk-free rates and three risk premiums.
- **Source and licence class.** Every fact records where it came from and carries one of seven licence classes, our label for what may be done with it, such as whether it may ever be shown to others.
- **India rules.** The rupee risk-free rate is India's 10-year government bond yield minus India's default spread, so sovereign risk is not counted twice. The equity risk premium (ERP, the extra return investors demand for owning shares instead of safe bonds) is the mature-market premium plus India's country premium. When an Indian industry has fewer than 10 companies, use the emerging-markets table, then the global one, and say which was used.
- **Ranges, not points.** Every valuation also comes with a sensitivity table and a Monte Carlo range (many re-runs with the inputs varied).
- **No advice, ever.** A test scans every report, memo and answer for the words buy, sell, hold and target price.

How we work:

- Outsource everything: no Docker, no servers of his own. The official copy of every number lives in the cloud database, never in a spreadsheet file (CSV) or a file database on the Mac (SQLite).
- Private always.
- Plain English first; PDFs and diagrams; technical detail in an appendix.
- Estimates, but never buy, sell, hold or a target price.
- Small scoped approvals, so he can read and think between steps.
- One folder, one branch, one tool (Claude Code in this folder since 15 September; the editor for the code built from M1 on is still open, see section 6 item 5).
- Markdown is the source; PDFs are built copies.

5 What was supposed to happen next (all parked until he says "go")

M0, the documents and diagrams, is done. The rest:

- **His reading, first.** PDF 1 (about 40 minutes), then PDF 2 one chapter an evening for seven evenings. Then say "go" or "page X confused me". PDF 5 after PDF 1; PDFs 3 and 4 later.
- **M1, accounts (him, three evenings).** GitHub two-factor login, with the recovery codes saved offline; Claude then creates the free organisation and the private code repository and hands him ownership, with secret scanning and push protection on. OpenRouter with \$20 of credit and a \$75 monthly limit, logging off, zero-data-retention on. Free accounts at Neon, Pinecone, Voyage, Cloudflare, Langfuse and Hex; Mistral pay as you go. Set up Cursor as the plan says (Privacy Mode on, the tool plug-in file, Plan mode; Cline optional); whether Cursor stays the editor is open, see section 6 item 5. Day-one exercise: find the cell "Mature Market ERP +" in the workbook (needs the corpus back). Done when every key is in place, the editor lists the

valuation tools, and he has read PDF 2.

- **M2, foundation build (Claude, days 3 to 7 after he says go).** Claude will set up the private code repository and build the calculator. The golden test will run automatically every time the code changes; this automatic check is called CI, short for continuous integration. The database will be proven to refuse any number that arrives without its source, licence label or date. Company filings will come from the SEC (the US market regulator) for Apple, Costco and three more US companies he chooses. Then the librarian, the memo writer, the tools for the editor, the nightly robots, the first Hex dashboard, and a walkthrough of every file. Done when `value_company AAPL US` prints a value with vintage and licence, a cited memo can be approved, the golden test fails as it should when the calculator is deliberately broken, and the dashboard shows the watchlist.
- **M3, he takes the wheel (weeks 2 to 4).** One guide chapter and one small change at a time. Done when he has merged five changes, the watchlist has 20 names with approved memos, and he can explain every rule out loud.
- **M4, India, accuracy, ranges, the market panel (weeks 4 to 8).** EODHD for Indian fundamentals (\$59.99 a month, the only planned paid data), the accuracy scoreboard at 90, 180 and 365 days, and the descriptive market panel that must reproduce Damodaran's September 2026 numbers: an implied equity risk premium of 4.09% (the extra yearly return over safe US government bonds that today's share prices imply investors demand) and an expected return of 8.84% (the total yearly return those prices imply). Both describe what the market is pricing in today; they are not a forecast or a promise of what shares will earn.
- **M5, only if other people ever use it.** A web front end, logins, commercial licences.

6 His open decisions

1. The private GitHub copy of Valuation: keep it or delete it. Also the empty public `fundamentas_of_finance` made at 10:19: keep, make private, or delete. Also whether this folder should ever be linked to GitHub again, since the rule for it was "no GitHub" (the future code repository is a separate thing). Also whether the older private copy on Cursor's git host (the folder as it was on 14 September) still exists, and whether to delete it.
2. Go or wait, after reading PDFs 1 and 2.
3. Which US companies go on the first watchlist: three beyond Apple and Costco for M2, then 20 names in total with approved memos by the end of M3 (the plan's watchlist is 20 to 50 names).
4. Yes or no to opening the free accounts at M1.
5. The daily editor: the plan says Cursor; on 15 September he chose Claude Code for this folder (the documents). Undecided for the code.
6. Where the corpus goes when it is rebuilt. Rebuilding the markdown copies at `~/Downloads/financeMD/` keeps the 133 citation paths working.
7. Small: set a spend limit on the OpenRouter key or rotate it, and make `~/Desktop/remaining/.env` readable by his account only.

7 What was done on 26 September after you approved

- The public GitHub repository was switched to private and the folder's link to it was removed. The private copy is yours to keep or delete. The empty `fundamentas_of_finance` repository was not touched.
- This document was written and built as PDF 6, and a new dated block was put at the top of `0-START-HERE.txt`.

- CLAUDE.md and HANDOFF.md (the notes Claude reads at the start of every session) were brought back in line with reality, and Claude's memory notes were updated.
- Nothing else changed: no accounts, no code, no deletions, no rebuild of PDFs 1 to 5.
